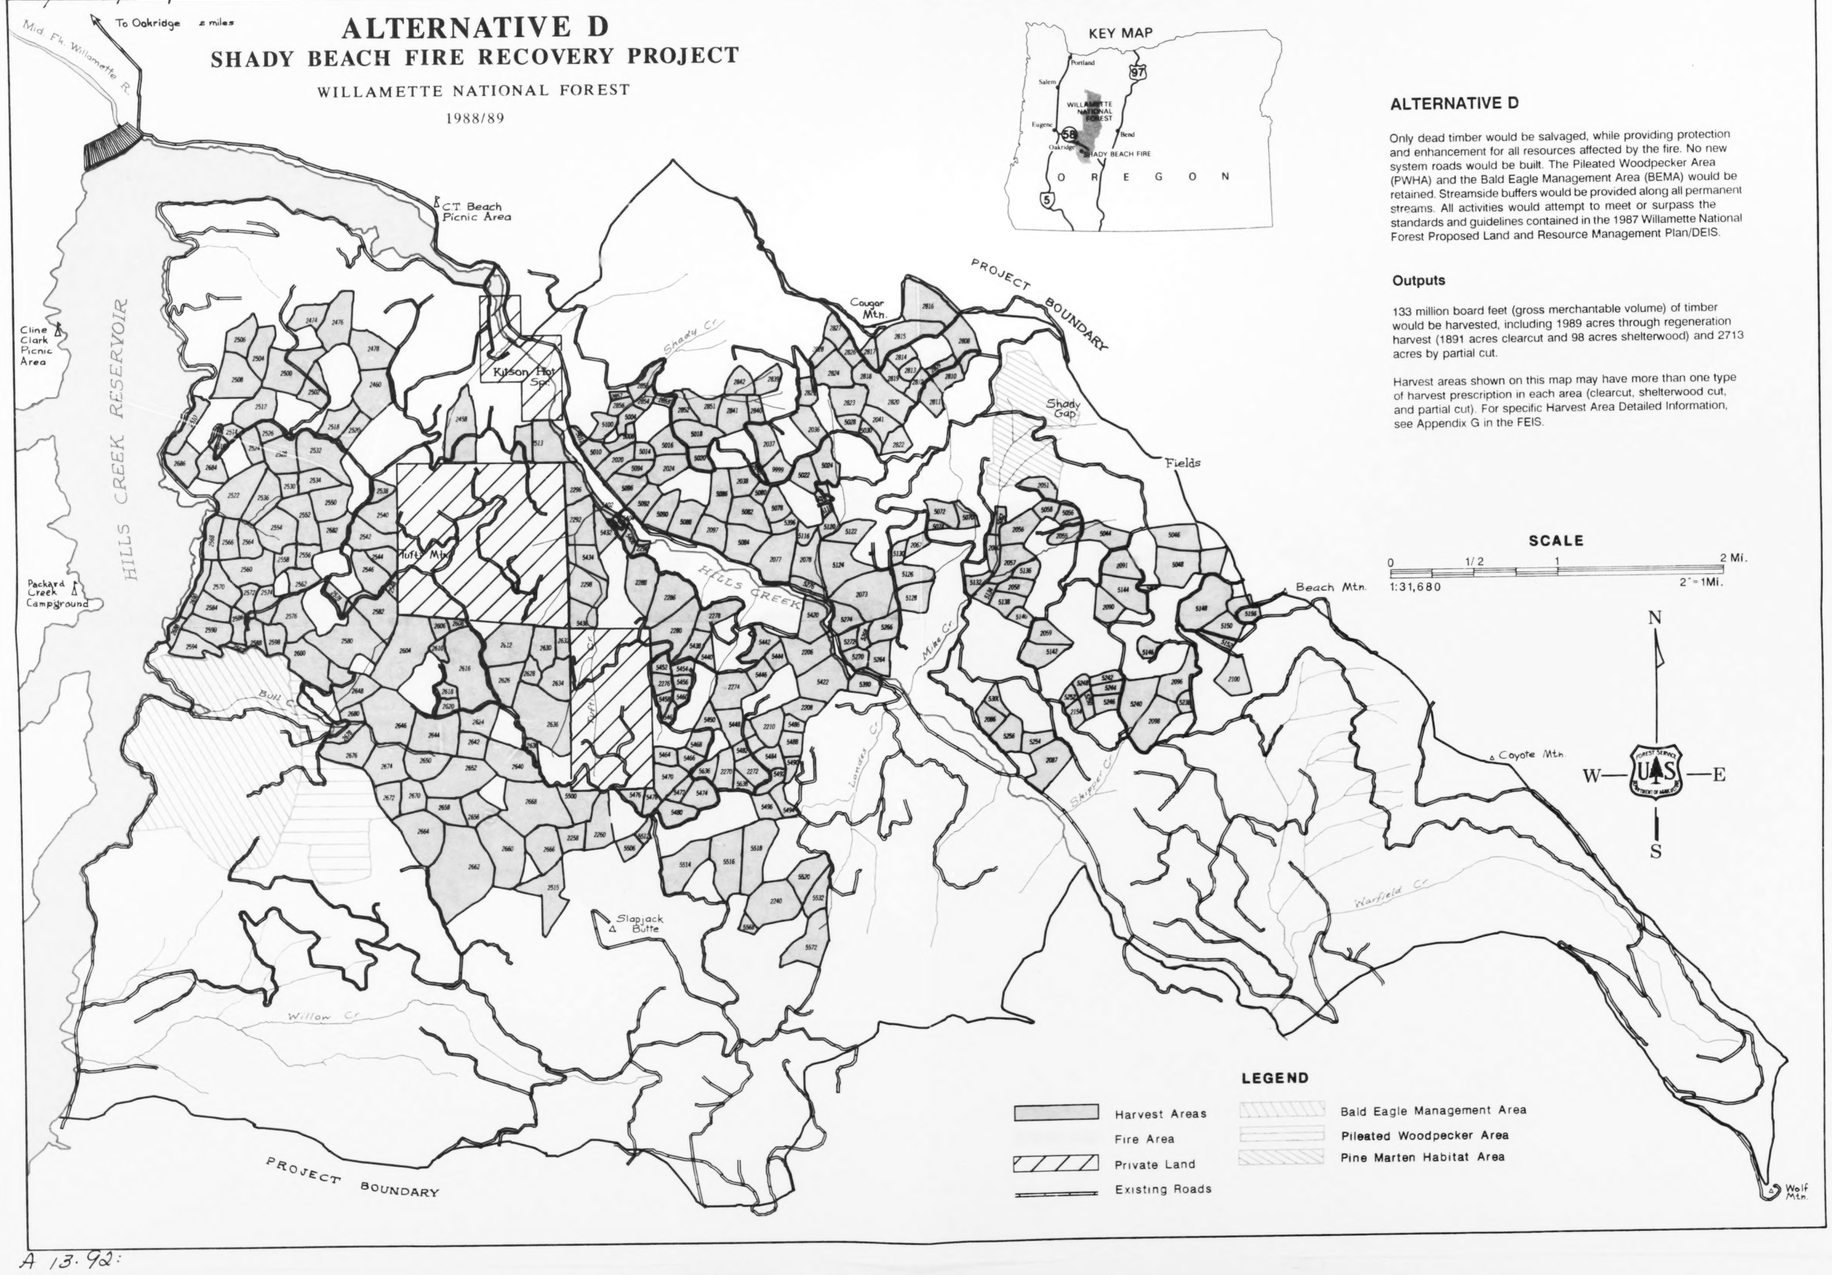
W 67/Alt. D/map

ALTERNATIVE D
SHADY BEACH FIRE RECOVERY PROJECT
WILLAMETTE NATIONAL FOREST
1988/89



ALTERNATIVE D

Only dead timber would be salvaged, while providing protection and enhancement for all resources affected by the fire. No new system roads would be built. The Pileated Woodpecker Area (PWHA) and the Bald Eagle Management Area (BEMA) would be retained. Streamside buffers would be provided along all permanent streams. All activities would attempt to meet or surpass the standards and guidelines contained in the 1987 Willamette National Forest Proposed Land and Resource Management Plan/DEIS.

Outputs

133 million board feet (gross merchantable volume) of timber would be harvested, including 1989 acres through regeneration harvest (1891 acres clearcut and 98 acres shelterwood) and 2713 acres by partial cut.

Harvest areas shown on this map may have more than one type of harvest prescription in each area (clearcut, shelterwood cut, and partial cut). For specific Harvest Area Detailed Information, see Appendix G in the FEIS.
